

Meditations of a Peripatetic Golfer

Treat your Bermuda greens just as is advised for creeping bent, and you will be delighted with the results.

Theory is worthless unless it leads to good results. Some greenkeepers are too prone to theorize.

A golf course with the first 4 holes measuring over 1,700 yards! At this rate the course would be 7,650 yards long. To play it would require seven-league boots.

Corrosive sublimate or bichloride of mercury is the best of all wormkillers. There is no basis for the idea that it accumulates in the soil and then ruins the turf.

Hole No. 1 on a golf course with its green quite invisible! What a thrill the members sitting on the front porch must get, especially if they are betting on who wins! No wonder the president is cursing the architect!

Letting the grass grow tall is the best known method of ruining the turf.

Never use manure of any sort anywhere on a golf course. Use Bunkum's fertilizer. Don't mind what the grass says.

Watering a putting green is best done in the morning, at noon, in the evening, or at night; but be sure to use a convenient time.

Chewing's fescue does not grow in bunches—except in about 90 percent of the cases.

A blind bunker is the "bunk." No reservations will be considered. If your putting greens are not good, look for criticism, not praise.

Any one can imitate the mechanical features of a golf course. But to be an artist who comprehends landscaping is another story.

Mow your putting greens every day in the growing season.

Florida golf clubs will be very grateful if every northern golfer will bring along a pocketful of real soil so as to improve their putting greens.

We don't quite see the relation between pretty bathing girls and golf. Maybe it is to stimulate the bald heads.
